
Wallelex Presents *Wallet MediCard™* for Personal Health Records
Entire Medical History—In Your Wallet

HIMSS08 – Orlando FL USA – February 25, 2008 (Booth # 7649)

Wallet MediCard™ is an ultra-thin, water-proof, robust, and secure credit card size USB Flash memory Drive that fits neatly in a wallet and serves as a platform for Personal Health Records (PHR) applications.

Wallet MediCard™ has a large, double-sided area that allows high quality, full color graphics printing, including vital medical data.

Memory capacities range from 1GB to 8GB, allowing users to carry their complete, updated medical history in a wallet, including large digital X-rays files.

In EMERGENCY SITUATIONS, rapid access to accurate medical information can be the key to saving a life. As a standard procedure, First Responders will look into the person's wallet, where they can easily find the Wallet MediCard™ and associate it with the injured person because the individual's photograph and personal details are printed on the outside of the card.

Wallet MediCard™ fits any USB port on standard computers used by Doctors and Paramedics, and doesn't need a special card reader. This complete medical data availability reduces medical errors, and delivers significant savings by avoiding unnecessary treatments and duplicate laboratory tests due to misplaced or inaccurate data.

With its built-in security features, Wallet MediCard™ helps PHR providers enhance compliance with HIPAA privacy and security regulations. Wallet MediCard™ is currently being used by both stand-alone and web-based Personal Health Records providers in the USA, and in pilot programs in some European countries.

When used in combination with web-based systems, Wallet MediCard™ can provide secure and convenient Internet access to remote medical data. It also provides offline access to the medical information stored on the card. This is especially important in offshore environments, or natural disasters, when Internet and telecommunications might not be available.
